# Acacia

**Built for Windows
Easy to learn**

Acacia is a **simple intuitive tool** designed to assist linguists who summarize the contents of foreign-language audio

VAD lets you jump to where the speech is in long-duration audio

Active timestamps synchronize your text with audio and video

Key features:

- Navigate the audio signal visually – click on it to jump to the point
- Integrated Voice Activity Detection (VAD) shows where speech occurs
- All common audio and video formats and encodings are supported
- Foot pedals and keyboard shortcuts provide efficient playback control
- Resize and position component windows across multiple monitors
- Reports are synchronized with the media file
- Active timestamps in reports link your text to a point in the media
- Reduce noise with adaptive filters and dynamic volume controls
- Easily create loops and control playback-speed with true pitch
- Mix stereo channels and control channel volume independently
- Align and play two mono files as stereo
- File panel shows which files have been reviewed and have reports

Simple integration into existing workflows
